Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10'8. The present invention is based upon the initial discovery of an alternative HER-2 menA transcript with 274 bp insert of intron 8. The translation product of the alternative transmenbrane and intracellular domains of p185HER-2 but contains ECD I II of the p185HER-2 and the novel ECDIII. The ECDIIIA-containing PCD I II of the p185HER-2 and thus antagonise the ECDIIIA-containing PCD is I of the p185HER-2 and thus antagonise the ECDIIIA-containing PCD is 10 to the P185HER-2 and thus antagonise of the HER-2 receptor. The peptides, which bind to an HER-2 ECD and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is p68HER-2 ECDIIIa variant encoded by Dymorphic form of human HER-2 intron 8. Note: The present sequence is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 (AAE09184)
                                                                                                                  HBR-2; herstatin; antagonist; extracellular domain; BCD; Herceptin; solid tumour; cancer; polymorphism; cytostatic; gene therapy; p68HER-2; ECDIIIa; variant.
                                                                                     Human p68HER-2 ECDIIIa variant 11 encoded by HER-2 intron 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 11; Page; 61pp; English

which binds to the extracellular domain of HER-2 for the

```
The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present antibody, Herceptin, at an affinity of at least 10°8. The present in Rention is based upon the initial discovery of an alternative HER-2 mend transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 und the novel BCDIIIa. The ECDIIIA-containing POlypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the containing bCDIIIa variant sequence is human p68HER-2 partial protein containing ECDIIIa variant sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

                                                                     임
                                                                                                                                                                    The present invention relates to a method for treating a solid tumour characterised by endothelial growth factor receptor (EGRR) expression. The method involves administering an agent that binds to an extracellular domain (BCD) of BGR. The invention also relates to an acturally occurring inhibitor of HBR-2 receptor tyrosine kinase called herstatin. The co-spression of herstatin with pi85HRR causes a striking reduction in cell growth that corresponds with suppression of p185 autophosphorylation. The method or a pharmaceutical composition is useful for treating a solid cumour (selected from squamous cell carcinoma, imp carcinoma and glial cell tumour) characterised by EGRR expression. The present sequence is HBR2 protein containing extracellular domain.
                                                                                                                                                                                                                            Endothelial growth factor receptor; EGFR; tumour; cytostatic; herstatin; HER-2 receptor tyrosine kinase; squamous cell carcinoma; lung; colon; glial cell tumour; cell growth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Treating solid tumor characterized by expression of endothelial growth factor receptor, involves administering recombinant herstatin that binds to extracellular domain of the endothelial growth factor receptor.

The invention relates to novel HER-2 (herstatin-2) antagonist

particularly a polypeptide that binds to the extracellular domain (ECD)

of HER-2 at a site that is different from the binding site of humanised

antibody, Herceptin, at an affinity of at least 10'8. The present
invention is based upon the initial discovery of an alternative HER-2

ment transcript with 274 bp insert of intron 8. The translation product
of the alternative transcript is a truncated HER-2 protein designated
psense. A which lacks the transmembrane and intracellular domains of
p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa-
The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise
the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the
nucleic acids encoding these are useful to treat, diagnose and identify
solid tumours. The present sequence is p68HER-2 ECDIIIA variant encoded
by polymorphic form of human HER-2 intron 8. Note: The present sequence
is not shown in the specification but is derived from HER-2 intron 8
encoded ECDIIIa sequence given in figure 8 (AAE09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.

The invention relates to movel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 menA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 but contains ECD i, II of the p185HER-2 and the novel ECDIIIa. The HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solld tumours. The present sequence is p68HER-2 ECDIIIa variant encoded by polymorphic form of human HER-2 intron 8. Note: The present sequence is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 (AAB09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polypeptide, which binds to the extracellular domain of {\tt HER-2} for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "p68HER-2 ECDIIIa (AAE09184) Asp substituted with
Asn which is encoded by CAC"
                                                                                                                                                                                                                                                                                                                     HER-2; herstatin; antagonist; extracellular domain; BCD; Herceptin; solid tumour; cancer; polymorphism; cytostatic; gene therapy; p68HER-2; ECDIIIa; variant.
Human p68HER-2 SCDIIIa variant 10 encoded by HER-2 intron 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      98.3%; Score 411; DB 4; Length 79; 98.7%; Pred. The invention relates to novel HER-2 (herstatin-2) antagonist

particularly a polypeptide that binds to the extracellular domain (ECD)

contibody, Herceptin, at an affinity of at least 10.8 The present

contibody, Herceptin, at an affinity of at least 10.8 The present

invention is based upon the initial discovery of an alternative HER-2

invention is based upon the initial discovery of an alternative HER-2

invention is based upon the initial discovery of an alternative HER-2

continuative transcript is a truncated HER-2 protein designated plasHER-2 but contains polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD; and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is possessers and identify by polymorphic form of human HER-2 intron 8. Note: The present sequence is not shown in the specification but is derived from HER-2 intron 8 concoded ECDIIIa expresent sequence is encoded ECDIIIa ecquence given in figure 8 (AAE09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polypeptide, which binds to the extracellular domain of HBR-2 for the treatment of hard tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HER-2/neu (erbb-2) oncogene encodes a receptor-like tyrosine kinase. The extracellular domain of p185-HER-2 is proteolytically shed from breast carcinoma cells in culture and is found in serum of some cancer patients and may be a serum marker of metastatic breast cancer. An alternative HER cardined intron is in-frame and encodes a 79 amino acid extension designated ECDILIa (the present sequence), which is inserted at residue concern (approximately 8, 8 kp) that lacks the transmembrane and concording introvaimately 8, 8 kp) that lacks the transmembrane and introvaimately 8, 8 kp) that lacks the transmembrane and introvaimately 8, 8 kp) that lacks the transmembrane and introvaimately 8, 8 kp) that lacks the transmembrane and introvaimately 8, 8 kp) that lacks the transmembrane and introvaimately 8, 8 kp) that lacks the transmembrane and introvaimately 8, 8 kp) that lacks the transmembrane and introvaimately 8, 8 kp) that lacks the transmembrane and interpretain from the site of binding for Hercepton (RTM) (a cancer and binds to the ECD of HER-2). The methods, compositions, polypeptides and antibodies are used to treat solid tumours such as preast cancer, small cell lung carcinoma, ovarian cancer and/or colon cancer, especially where over-expression of HER-2 is indicated

The invention relates to novel HER-2 (herstatin-2) antagonist (ECD) particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised artibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 invention is based upon the initial discovery of an alternative HER-2 of the alternative transcript is a truncated HER-2 protein designated of the alternative transcript is a truncated HER-2 protein designated be MERER-2 which lacks the transmembrane and intracellular domains of plasHER-2 which toorianing Bolypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides which bind to an HER-2 ECD, and the concluding these are useful to treat, diagnose and identify solid tumours. The present sequence is ECDIIIa domain of human p68HER-2 protein encoded by intron 8 of HER-2 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              数据数据数据
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for treating a solid tumour characterised by endochelial growth factor receptor [EGFR] expression. The method involves administering an agent that binds to an extracellular domain (ECD) of EGFR. The invention also relates to an acturally occurring inhibitor of HER-2 receptor tyrosine kinase called herstatin. The co-syression of herstatin with pl85HER2 causes a striking reduction in cell growth that corresponds with suppression of pl85 autophosphorylation. The method or a pharmaceutical composition is useful for treating a solid cumour (selected from squamous cell carcinoma, colon carcinoma and glial cell tumour) characterised by EGFR expression. The present sequence is a protein encoded by human HER2 introm

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 means termative transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated be BRSHR-2 which lacks the transmembrane and intracellular domains of pl85HER-2 but contains ECD I. II of the pl85HSR-2 and the novel ECDIII. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the KER-2 receptor. The peptides, which bind to an HER-2 ECDIIIa antagonise conclete acceptor. The present sequence is p68HER-2 ECDIIIa variant encoded solid tumours. The present sequence is p68HER-2 ECDIIIa variant encoded is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 (AAE09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                          'note= "p68HER-2 ECDIIIa (AAE09184) Leu substituted with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9

The invention relates to novel HBR-2 (herstatin-2) antagonist

particularly a polypeptide that binds to the extracellular domain (BCD)

of HBR-2 at a site that is different from the binding site of humanised

antibody, Herceptin, at an affinity of at least 10.8. The present

invention is based upon the initial discovery of an alternative HER-2

mRNA transcript with 274 bp insert of intron 8. The translation product

of the alternative transcript is a truncated HER-2 protein designated

p68HER-2 which lacks the transmembrane and intracellular domains of

p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa.

The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise

the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the

nucleic acids encoding these are useful to treat, diagnose and identify

solid tumours. The present sequence is p68HER-2 ECDIIIA variant encoded

by polymorphic form of human HER-2 intron 8 Note: The present sequence

is not shown in the specification but is derived from HER-2 intron 8

encoded ECDIIIa equence given in figure 8 (AAB09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "p68HER-2 ECDIIIa (AAE09184) Met substituted with

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10'8 The present invention is based upon the initial discovery of an alternative HER-2 invention is based upon the initial discovery of an alternative HER-2 ment transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains BCD I, II of the p185HER-2 and the novel BCDIIIa. The HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is p64HER-2 ECDIIIA variant encoded by polymorphic form of human HER-2 intron 8. Note: The present sequence is encoded from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 (AAE09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

```
The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site inta different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10'8. The present invention is based upon the initial discovery of an alternative HER-2 ment that an action the initial discovery of an alternative HER-2. The alternative transcript is a truncated HER-2 protein designated of the alternative transcript is a truncated HER-2 protein designated of the alternative transcript is a truncated HER-2 protein designated bi 985HER-2 but contains ECD I. II of the plasHER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECDIIIa variant encoded cold tumours. The present sequence is p68HER-2 ECDIIIa variant encoded is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 (AAE09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody. Herceptin, at an affinity of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p84HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains BCD I, II of the p185HER-2 and the novel ECDIIIa. The HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is p68HER-2 ECDIII avariant encoded by polymorphic form of human HER-2 intron 8. Note: The present sequence is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 (AAE09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 but contains ECD i, II of the p185HER-2 and the novel ECDIIIa. The HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is p68HER-2 ECDIIIa variant encoded by plymorphic form of human HER-2 intron 8. Note: The present sequence is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 (AAE09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                    New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (BCD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated of the alternative transcript is a truncated HER-2 protein designated in BSHER-2 but contains BCD I. II of the p185HER-2 and the novel ECDIII. THE ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the ECDIIIA-containing polypeptides, which bind to an HER-2 ECDIIIa antagonise of the HER-2 receptor. The peptides, which bind to an HER-2 brother contains the present sequence is p68HER-2 ECDIIIa variant encoded by purporphic form of human HER-2 intron 8. Note: The present sequence is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 (AAEG9184)
                                                                                                                                                                                                                                                                                                                                                                                                                                          which binds to the extracellular domain of HER-2 for the

Human p68HER-2 ECDIIIa variant 13 encoded by HER-2 intron 8.

```
The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affainty of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative translation product pseHER-2 which lacks the transmembrane and intracellular domains of pseHER-2 but contains ECD i, II of the p185HER-2 and the novel ECDIIIa. The BCDIIIA containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is pseHER-2 ECDIIIA variant encoded by polymorphic form of human HER-2 intron 8. Note: The present sequence is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 (AAE09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10'8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of introm 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p8 HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is p68HER-2 ECDIIIIa variant encoded to by polymorphic form of human HER-2 introm 8. Note: The present sequence is not shown in the specification but is derived from HER-2 introm 8 encoded ECDIIIa sequence given in figure 8 (AAE09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New polypeptide, which binds to the extracellular domain of {\tt HER-2} for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 CTHSLLPRPAAVDVPLRMQPGPAHPVLSFLRPSWDLVSAFYSLPLAPLSPTSVPISPVSV 60

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative translation is a truncated HER-2 protein designated p88HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains BCD I II of the p185HER-2 and the novel BCDIIIa. The BCDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is p68HER-2 ECDIIIA variant encoded by polymorphic form of human HER-2 intron 8. Note: The present sequence is by polymorphic form of human HER-2 intron 8. Note: The present sequence is not shown in the specification but is derived from HER-2 intron 8 encoded ECDIIIa sequence given in figure 8 (AAB09184)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9

Human p68HER-2 generic protein variant 11.

(first entry)

15-NOV-2001

```
New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 774 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p165HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10.8 The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains BCD I, II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p6HER-2 generic protein containing ECDIIIa variant sequence. Note: The pfersent sequence is not shown in the specification but is derived from p6HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAB09181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 GTHSLLPRPAAVPVPLRMQPGPAHPVLSFLRPSWDLVSAFYSLPLAPLSPTSVPISPVSV 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "Represented as Agn in the parent sequence shown in the specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HER-2; herstatin; antagonist; extracellular domain; ECD; Herceptin; solid tumour; cancer; polymorphism; cytostatic; gene therapy; p69HER-2; ECDIIIa; variant.

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of introm 8. The translation product of the alternative transmembers and intracellular domains of pseHER-2 but containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the uncleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human poBHER-2 generic protein containing ECDIIIa variant sequence. Note: The present sequence is not containing ECDIIIa variant sequence. Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence is EEQ ID NO:2) shown in the sequence listing (AAEO9181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                          generic sequence (AAE09181) Xaa

```
HER-2/neu (erbB-2) oncogene encodes a receptor-like tyrosine kinase. The extracellular domain of p185-HER-2 is proteolytically shed from breast carcinoma cells in culture and is found in serum of some cancer patients and may be a serum marker of metastatic breast cancer. An alternative HER -2 mRNA of 4.8 kb with a 274 bp insert (intron 8) has been identified. The retained intron is in-frame and encodes a 79 amino acid extension designated ECDIIIa (the present sequence), which is inserted at residue 340 of p185-HER-2. The alternative mRNA predicts a truncated HER-2 protein (approximately 68 kDa) that lacks the transmembrane and intracellular domains (see AAY97240). p68HER-2 specifically binds to p185-HER-2 without activating HER-2. it could therefore block dimerization of p185-HER-2. The p68HER-2 polypeptide binds to a site on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Using polypeptides and antibodies that bind to the extracellular domain of the receptor-like tyrosine kinase HER-2 to treat solid tumors of the breast, lung, ovaries and colon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Adelman JP;

the ECD of HER-2 that is different from the site of binding for Eerceptin (RTM) (a marketed humanized monoclonal antibody that is used for the treatment of cancer and binds to the ECD of HER-2). The methods, compositions, polypeptides and antibodies are used to treat solid tumours such as breast cancer, small ell lung carcinoma, ovarian cancer and/or colon cancer, especially where over-expression of HER-2 is indicated

                                                                                                                                                                                                                                                                                                                     which binds to the extracellular domain of HBR-2 for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mENA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated pl85HER-2 which lacks the transmembrane and intracellular domains of pl85HER-2 but contains ECD I. II of the pl85HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 ECDIIIa peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 60

```
The present invention relates to a method for treating a solid tumour characterised by endothelial growth factor receptor (EGFR) expression. The method involves administering an agent that binds to an extracellular domain (ECD) of EGFR. The invention also relates to an acturally occurring inhibitor of HER-2 receptor tyrosine kinase called herstatin. The co-expression of herstatin with pl85HER2 causes a striking reduction in cell growth that corresponds with suppression of pl85 autophosphorylation. The method or a pharmaceutical composition is useful for treating a solid carcinoma and glial cell tumour (selected from gramour) characterised by EGFR expression. The present sequence is a protein encoded by human HER2 intron 8 polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating solid tumor characterized by expression of endothelial growth factor receptor, involves administering recombinant herstatin that binds to extracellular domain of the endothelial growth factor receptor.

```
New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 11; Page; 61pp; English.

of the alternative transcript is a truncated HER-2 protein designated BSBERR-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I. II of the p185HER-2 and the novel ECDIIIa. The ECDIIIA-containing polypeptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAB09181)
                                                                                                                                                                                   9

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10.8. The present invention is based upon the initial discovery of an alternative HER-2 mRNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated p68HER-2 which lacks the transmembrane and intracellular domains of p185HER-2 but contains ECD I, II of the p185HER-2 and the novel ECDIIIa. The HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The peptides bind tightly to, and thus antagonise the HER-2 receptor. The sequence is human p68HER-2 generic protein containing ECDIIIa variant sequence. Note: The present sequence is not shown in the specification but is derived from p68HER-2 generic sequence is more shown in the sequence listing (AAE09181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      341 GXHSXXPRPAAVPVPXRXQPXPAHPVLSFLRPSWDIVSAFYSLPLAPLDPTSVXISPVSV 400

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10^8. The present invention is based upon the initial discovery of an alternative HER-2 mNNA transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated of the alternative transcript is a truncated HER-2 protein designated of BESHER-2 but contains ECD I. II of the p185HER-2 and the novel ECDIII. The ECDIIA-containing polypeptides bind tightly to, and thus antagonise to the HER-2 receptor. The peptides, which bind to an HER-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein containing ECDIIIa variant sequence is human p68HER-2 generic sequence is not shown in the specification but is derived from p68HER-2 generic sequence (SEQ ID NO:2) shown in the sequence listing (AAE09181)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.

The invention relates to novel HER-2 (herstatin-2) antagonist particularly a polypeptide that binds to the extracellular domain (ECD) of HER-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present invention is based upon the initial discovery of an alternative HER-2 many transcript with 274 bp insert of intron 8. The translation product of the alternative transcript is a truncated HER-2 protein designated of EMBRA transcript with 274 bp insert of intracellular domains of 1985HER-2 but contains ECD I. Il of the p185HER-2 and the novel ECDIIA. The PEDIIA-containing polypeptides bind tightly to, and thus antagonise the ECDIIA-containing polypeptides, which bind to an ERR-2 ECD, and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human p68HER-2 generic protein shown in the specification but is derived from p68HER-2 generic sequence is not shown in the sequence listing (AAE09181) 400 which binds to the extracellular domain of HER-2 for the HER-2; herstatin, antagonist, extracellular domain; ECD; Herceptin; solid tumour; cancer; polymorphism; cytostatic; gene therapy; p68HER-2; ECDIIIa; variant. /note= "Represented as Agn in the parent sequence shown in the specification" note= "Represented as Agn in the parent sequence shown in the specification" 1 GTHSLLPRPAAVEVPLRMQPGPAHPVLSFLRPSWDLVSAFYSLPLAPLSPTSVPISPVSV Gaps .340

LITERALLY A polypeptide that binds to the extracellular domain (BCD) of HBR-2 at a site that is different from the binding site of humanised antibody, Herceptin, at an affinity of at least 10°8. The present contribody, Herceptin, at an affinity of at least 10°8. The present convention is based upon the initial discovery of an alternative HBR-2 man transcript with 274 by insert of intron 8. The translation product of the alternative transcript is a truncated HBR-2 protein designated be BHBR-2 which lacks the transmembrane and intracellular domains of permanents and polypeptides bind tightly to, and thus antegonise the HBR-2 receptor. The peptides, which bind to an HBR-2 BCD and the nucleic acids encoding these are useful to treat, diagnose and identify solid tumours. The present sequence is human posses, 2 generic protein containing BCDIIIa evaluate the sequence. Note: The present sequence is not shown in the specification but is derived from posses.
                                                                                                                                                                                                                                                                                                                                                                                                                                             New polypeptide, which binds to the extracellular domain of HER-2 for the treatment of hard tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel HER-2 (herstatin-2) antagonist

US-09-252-91A-24956
i Sequence 24956, Application US/0925291A
Facent No. 6551795
GENERAL INFORMATION:
APPLICATION:
ITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
ITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
ITLE REPREBRENCE: 107196.136
CURRENT PILING DATE: 1999-02-18
FRIOR PELICATION NUMBER: US/09/252,991A
CURRENT PILING DATE: 1999-02-18
FRIOR FILING DATE: 1998-02-18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ب

Sequence 12642, Application US/09489039A

Patent No. 6610836
GENERAL INFORMATION:
APPLICATION: GALVE Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: NUMBER: US/09/489,039A
CURRENT APPLICATION NUMBER: US/09/489,039A
CURRENT FILING DATE: 2000-01-27
PRIOR PELLING DATE: 1999-01-29
PRIOR PILLING DATE: 1999-01-29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  83 WORLPALL-LPVRELMILPPRRPWOPILIOPASAAPSLISPLPAPAAPVRAVSAVPVPPP 141
